New gear format introduced with the Aquatica AD7000

Along with their super light housing for the Nikon® D7000, Aquatica is introducing a new line of Focus & Zoom gears. In recent years there has been a tendency from the lenses manufacturers to come out with larger and bigger lenses and this trend has all but stretched the limit of our older existing gears system, while every significant gear in underwater photography is supported by the existing gear system, it was nonetheless deemed wise to prepare for future optical offerings, the new line address all popular lenses used nowadays while still having plenty of dimensional space for upcoming lenses, should they become any larger.

The catalogue numbering differs slightly, the first digit being replaced by a 4 for the newer version. As an example, the existing gear item number for the Popular Tokina® is # 18717; the newer version is simply renamed # 48717

Some gears will retain the same number denomination, namely those macro lenses normally used with our AF/MF Macro port (# 18426), the change only affects lens being accessed via the housing focus/zoom controls.

Please rest assured that there is no plan to discontinue the existing gears for our current housings, they are still and will continue to be available. As we introduce newer DSLR housings in the future they will benefit from the newer larger type of gear.

A dedicated lens chart (type 4) is in the work for this housing and will be made available shortly, it will be available from the Aquatica AD7000 housing page or should you want a copy e-mailed directly to you, simply make a request for one at [info@aquatica.ca](mailto:info@aquatica.ca) and one will be forwarded to you as soon as it becomes available.

On another note:

Also as a reminder, please don't forget that Aquatica is now including the Hydrophone and moisture alarm free of charge with the Aquatica AD7000, that an added value of 219.00 USD!
